Cleaning your Spin clean filter.

While the filter is running you can clean your spin clean filter. Follow the directions on how to clean the filter. (PLEASE NOTE THESE ARE FOR MANUAL CLEANING ONLY.)

- While the pump is still running connect the discharge pipe to the side valve, so the dirty water is directed to where you require it.
- Now the pipe is in place open the red valve for models 12000+
If you have a smaller filter, remove the cap with the bung in, remove the bung and insert the part from the pipe and place back in the pipe and attach the pipe to the filter
- Now turn the blue valve on the top of the unit towards the red valve or open cap
- Water should now start to run through the discharge pipe on to the garden etc.
- Choose a direction to clean the filter clockwise or anti clockwise and turn the handle.
- Keep doing this for a few minutes!
- Once done stop and wait for water to run clear from the discharge pipe
- Turn blue handle to face towards the pond outlet (water should now start to flow down the waterfall or back to the pond)
- Close red valve 12000+ or smaller model reverse the procedure from earlier to place the bung back.
- Disconnect the hose from the filter
- Check the blue light of the UV

The above process works best with a clean pump but can still be done if pump is running slow.
